I. Listing of Claims

Please amend the Claims as follows:

(Cancelled).

(Cancelled).

3. (Currently Amended) A side curtain air bag, which includes

Case No. 12400-071

chambers expanded by gas supplied from a gas generator, and expands and

develops into a curtain shape along a side part of a vehicle so as to protect

vehicle occupants, the side curtain air bag comprising:

at least one primary chamber respectively defining an aperture that

provides fluid communication between the primary chamber and the gas

generator, the primary chamber being expandable by gas supplied by the gas

generator so as to protect an occupant;

at least one secondary chamber immediately adjacent to the primary

chamber and defining an opening that provides direct fluid communication

between the primary chamber and the secondary chamber so that the secondary

chamber is expandable by receiving the inflow of gas directly from the primary

chamber, and the gas generator, the secondary chamber being expandable by

gas supplied by the gas generator, the aperture and the opening being sized

such that the aperture is substantially larger than the opening so that the

secondary chamber begins to substantially expand and develop after the primary

Case No. 12400-071

chamber is approximately fully expanded and developed by gas from the gas

generator, and when the gas is generated by the gas generator, high pressure is

applied initially to the primary chamber, whereas the secondary chamber

gradually increases in pressure to be about the same as pressure of the primary

chamber: and

at least two tethers, each tether having one end attached to the side

curtain air bag at a joint end and the other end attached to a vehicle at a fixation

end,

wherein, when the side curtain air bag is expanded and developed, the

primary chamber and the secondary chamber are arranged such that a portion or

all of the primary chamber and a portion or all of the secondary chamber

respectively overlap a virtual band, the virtual band being formed along a virtual

line connecting the respective joint ends of the at least two tethers, the virtual

band defining a region where tension is applied across the side curtain air bag

when the primary chamber is approximately fully expanded and developed and

the secondary chamber begins to substantially expand and develop.

4. (Cancelled).

5. (Cancelled).

- 3 -

Case No. 12400-071

(Previously Presented) A side curtain air bag, which includes chambers expanded by gas supplied from a gas generator, and expands and develops into a curtain shape along a side part of a vehicle so as to protect vehicle occupants, the side curtain air bag comprising:

at least one primary chamber respectively defining an aperture that provides fluid communication between the primary chamber and the gas generator, the primary chamber being expandable by gas supplied by the gas generator so as to protect an occupant;

at least one secondary chamber immediately adjacent to the primary chamber and defining an opening that provides direct fluid communication between the primary chamber and the secondary chamber so that the secondary chamber is expandable by receiving the inflow of gas directly from the primary chamber, and the gas generator, the secondary chamber being expandable by gas supplied by the gas generator, the aperture and the opening being sized such that the aperture is substantially larger than the opening so that the secondary chamber begins to substantially expand and develop after the primary chamber is approximately fully expanded and developed by gas from the gas generator, and when the gas is generated by the gas generator, high pressure is applied initially to the primary chamber, whereas the secondary chamber gradually increases in pressure to be about the same as pressure of the primary chamber;

at least two tethers, each tether having one end attached to an

Case No. 12400-071

attachment point on the side curtain air bag at a joint end and the other end

attached to a vehicle at a fixation end, in a forward and backward direction of the

vehicle,

wherein, when the side curtain air bag is expanded and developed,

the primary chamber and the secondary chamber are arranged such that a

portion or all of the primary chamber and a portion or all of the secondary

chamber respectively overlap a virtual band, the virtual band being formed

between a first virtual line connecting respective upper ends of the attachment

points of the tethers and a second virtual line connecting respective lower ends

of the attachment points of the tethers, the virtual band defining a region where

tension is applied across the side curtain air bag when the primary chamber is

approximately fully expanded and developed and the secondary chamber begins

to substantially expand and develop.

7. (Canceled).

(Cancelled).

9. (Previously Presented) A side curtain air bag, which includes

chambers expanded by gas supplied from a gas generator, and expands and

- 5 -

Case No. 12400-071

develops into a curtain shape along a side part of a vehicle so as to protect vehicle occupants, the side curtain air bag comprising:

at least one primary chamber respectively defining an aperture that provides fluid communication between the primary chamber and the gas generator, the primary chamber being expandable by gas supplied by the gas generator so as to protect an occupant;

at least one secondary chamber immediately adjacent to the primary chamber and defining an opening that provides direct fluid communication between the primary chamber and the secondary chamber so that the secondary chamber is expandable by receiving the inflow of gas directly from the primary chamber, and the gas generator, the secondary chamber being expandable by gas supplied by the gas generator, the aperture and the opening being sized such that the aperture is substantially larger than the opening so that the secondary chamber begins to substantially expand and develop after the primary chamber is approximately fully expanded and developed by gas from the gas generator, and when the gas is generated by the gas generator, high pressure is applied initially to the primary chamber, whereas the secondary chamber gradually increases in pressure to be about the same as pressure of the primary chamber; and

at least two tethers, each tether having a joint end attached to the side curtain air bag at an attachment point on the side curtain air bag and a fixation end attached to a vehicle, in a forward and backward direction of the vehicle,

wherein, when the side curtain air bag is expanded and developed, the

Case No. 12400-071

primary chamber and the secondary chamber are arranged such that a portion

or all of the primary chamber and a portion or all of the secondary chamber

respectively overlap a virtual band, the virtual band being formed between a first

virtual line connecting an upper end of the attachment point of one tether and

the fixation end of the other tether, and a second virtual line connecting

respective lower ends of the attachment points of the tethers, the virtual band

defining a region where tension is applied across the side curtain air bag when

the primary chamber is approximately fully expanded and developed and the

secondary chamber begins to substantially expand and develop.

10. (Canceled).

11. (Cancelled).

12. (Previously Presented) The side curtain air bag according to claim 3,

wherein pressure in the primary chamber has reached a maximum value before

the secondary chamber begins to substantially expand and develop and the

primary chamber continuously decreases in pressure as the secondary chamber

expands and develops.

-7-

App. No. 10/577,372 Reply to Non-Final Office Action of June 3, 2009

13. (Previously Presented) The side curtain air bag according to claim 6.

Case No. 12400-071

wherein pressure in the primary chamber has reached a maximum value before

the secondary chamber begins to substantially expand and develop and the

primary chamber continuously decreases in pressure as the secondary chamber

expands and develops.

14. (Previously Presented) The side curtain air bag according to claim 9.

wherein pressure in the primary chamber has reached a maximum value before

the secondary chamber begins to substantially expand and develop and the

primary chamber continuously decreases in pressure as the secondary chamber

expands and develops.

15. (Previously Presented) The side curtain air bag according to claim

3, wherein the pressure of the secondary chamber gradually increases to be

about the same as the pressure of the primary chamber by about 4 seconds or

thereafter.

16. (Previously Presented) The side curtain air bag according to claim

6, wherein the pressure of the secondary chamber gradually increases to be

about the same as the pressure of the primary chamber by about 4 seconds or

thereafter.

- 8 -

App. No. 10/577,372 Reply to Non-Final Office Action of June 3, 2009

7. (Previously Presented) The side curtain air bag according to claim

Case No. 12400-071

9, wherein the pressure of the secondary chamber gradually increases to be

about the same as the pressure of the primary chamber by about 4 seconds or

thereafter.

18. (Cancelled).

19. (Cancelled).

(Cancelled).

21. (New) The side curtain air bag according to claim 3 further

comprising a gas supply passage formed therein extending along a forward and

backward direction of the vehicle for providing fluid communication between the

gas generator and the primary chamber.

22. (New) The side curtain air bag according to claim 21 further

comprising a gas supply port disposed on a trailing end side of the gas supply

passage.

23. (New) The side curtain air bag according to claim 21 wherein

the secondary chamber is disposed in front of the primary chamber, which is a

- 9 -

forefront primary chamber, and the secondary chamber and the forefront primary

Case No. 12400-071

chamber are juxtaposed in a forward and backward direction of the vehicle.

24. (New) The side curtain air bag according to claim 23, wherein

the gas supply passage is not directly connected to the secondary chamber, and

an inside of the secondary chamber is directly connected to an inside of the

forefront primary chamber via the opening.

25. (New) The side curtain air bag according to claim 21 wherein

the secondary chamber is disposed further behind the primary chamber, which is

a rearmost primary chamber, and the secondary chamber and the rearmost

primary chamber are juxtaposed in a forward and backward direction of the

vehicle.

26. (New) The side curtain air bag according to claim 25, wherein

the gas supply passage is not directly connected to the secondary chamber, and

an inside of the secondary chamber is directly connected to an inside of the

rearmost primary chamber via the opening.

27. (New) The side curtain air bag according to claim 6 further

comprising a gas supply passage formed therein extending along a forward and

- 10 -

Reply to Non-Final Office Action of June 3, 2009 backward direction of the vehicle for providing fluid communication between the

Case No. 12400-071

gas generator and the primary chamber.

28. (New) The side curtain air bag according to claim 27 further

comprising a gas supply port disposed on a trailing end side of the gas supply

passage.

29. The side curtain air bag according to claim 27 wherein (New)

the secondary chamber is disposed in front of the primary chamber, which is a

forefront primary chamber, and the secondary chamber and the forefront primary

chamber are juxtaposed in a forward and backward direction of the vehicle.

30. (New) The side curtain air bag according to claim 29, wherein

the gas supply passage is not directly connected to the secondary chamber, and

an inside of the secondary chamber is directly connected to an inside of the

forefront primary chamber via the opening.

31. (New) The side curtain air bag according to claim 27 wherein

the secondary chamber is disposed further behind the primary chamber, which is

a rearmost primary chamber, and the secondary chamber and the rearmost

primary chamber are juxtaposed in a forward and backward direction of the

vehicle.

- 11 -

App. No. 10/577,372 Reply to Non-Final Office Action of June 3, 2009

32. (New) The side curtain air bag according to claim 31, wherein

Case No. 12400-071

the gas supply passage is not directly connected to the secondary chamber, and

an inside of the secondary chamber is directly connected to an inside of the

rearmost primary chamber via the opening.

33. (New) The side curtain air bag according to claim 9 further

comprising a gas supply passage formed therein extending along a forward and

backward direction of the vehicle for providing fluid communication between the

gas generator and the primary chamber.

34. (New) The side curtain air bag according to claim 33 further

comprising a gas supply port disposed on a trailing end side of the gas supply

passage.

35. (New) The side curtain air bag according to claim 33 wherein

the secondary chamber is disposed in front of the primary chamber, which is a

forefront primary chamber, and the secondary chamber and the forefront primary

chamber are juxtaposed in a forward and backward direction of the vehicle.

36. (New) The side curtain air bag according to claim 35, wherein

the gas supply passage is not directly connected to the secondary chamber, and

- 12 -

an inside of the secondary chamber is directly connected to an inside of the

Case No. 12400-071

forefront primary chamber via the opening.

37. (New) The side curtain air bag according to claim 33 wherein

the secondary chamber is disposed further behind the primary chamber, which is

a rearmost primary chamber, and the secondary chamber and the rearmost

primary chamber are juxtaposed in a forward and backward direction of the

vehicle.

38. (New) The side curtain air bag according to claim 37, wherein

the gas supply passage is not directly connected to the secondary chamber, and

an inside of the secondary chamber is directly connected to an inside of the

rearmost primary chamber via the opening.
